

A Decade of Polar Stratospheric Cloud Observations from CALIOP

Michael C. Pitts¹ and Lamont R. Poole²

¹NASA Langley Research Center, Hampton, VA

²Science Systems & Applications, Inc., Hampton, VA

*CALIPSO–CloudSat Ten–Year Progress Assessment and Path–Forward Workshop
8–10 June 2016, Paris, France*

What are Polar Stratospheric Clouds (PSCs) and why are they important?

- PSCs form in the Antarctic and Arctic stratosphere at temperatures below ~ 195 K
- Three known particle compositions: liquid super-cooled ternary solution (STS) $\text{H}_2\text{SO}_4\text{-HNO}_3\text{-H}_2\text{O}$ droplets, nitric acid trihydrate (NAT) crystals, and H_2O ice
- PSCs play key roles in chemical depletion of ozone at high latitudes
 - Heterogeneous (mixed-phase) reactions on PSC particle surfaces convert inactive chlorine reservoirs (HCl and ClONO_2) to active (ozone-depleting) chlorine radicals
 - Sedimentation of large NAT particles irreversibly removes odd nitrogen (denitrification), which delays chlorine deactivation and prolongs ozone depletion
- Significant gaps in knowledge still exist
 - Large solid particle formation and their denitrification potential (NAT rocks)
 - Extent of chlorine activation on cold background stratospheric aerosol
 - Limit our ability to accurately represent PSCs in global models and call into

CALIPOP has greatly expanded our PSC database

Typical Daily Antarctic Winter Coverage
2008/07/17 (blue=night, red=day)

- Historical PSC database rather sparse
- Extensive measurement coverage over polar regions into polar night
- High spatial resolution (5-km horizontal x 180-m vertical resolution PSC product)
- Combination of total backscatter and polarization sensitive measurements provide information on PSC composition

532 nm Total Attenuated Backscatter, 2008-07-17

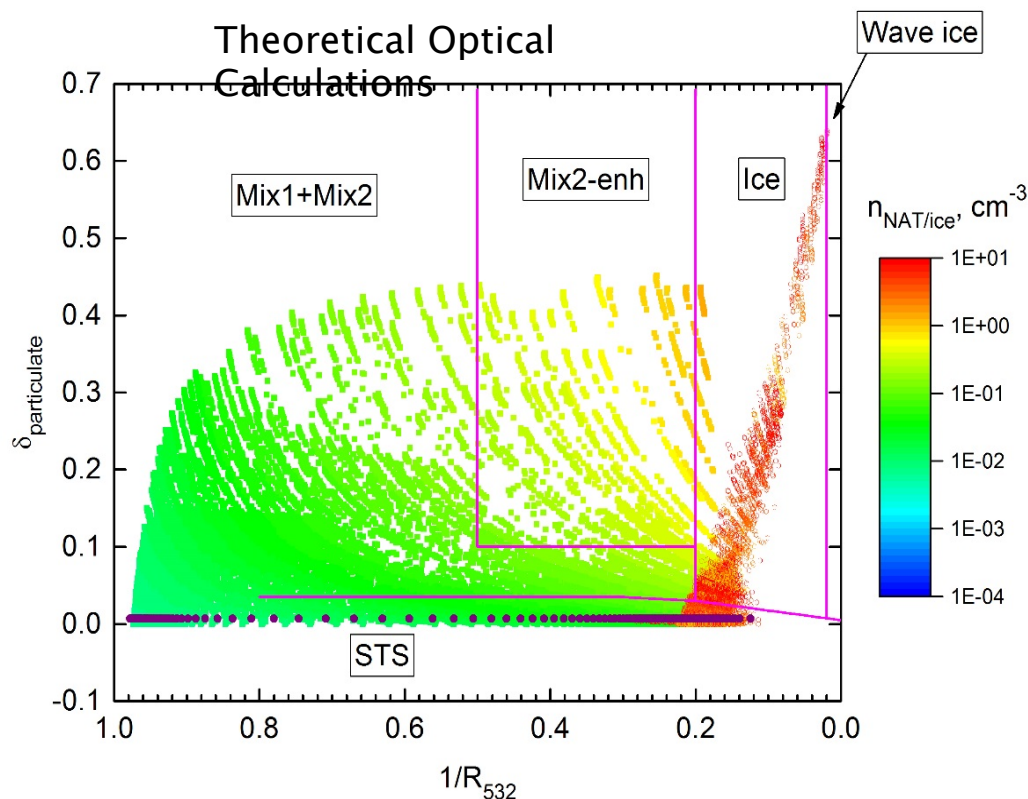

PSC Detection and Composition Classification

Pitts et al., ACP, 2007; 2009; 2011; 2013

- PSCs are detected as statistical outliers from background aerosol using nighttime 532-nm scattering ratio (total/molecular backscatter, R_{532}) and perpendicular backscatter, β_{\perp}
- Composition classification based on comparison of CALIOP particle depolarization ratio δ_p and inverse scattering ratio $1/R_{532}$ observations with theoretical optical calculations
 - PSCs separated into five composition classes
 - β_{\perp} outliers: NAT mixtures/ice; R_{532} outliers: STS
 - Boundary between Mix2-enh and ice is also adjusted to account for effects of denitrification and dehydration
- CALIPSO Level 2 PSC data product available from Langley Atmospheric Sciences Data Center:

- ❖ STS = supercooled ternary ($\text{H}_2\text{SO}_4\text{-H}_2\text{O-HNO}_3$) solution
- ❖ Mix1+Mix2, Mix 2-enh(anced) = external mixtures of liquid (binary H_2SO_4 aerosol or STS) droplets and NAT particles (in increasing number density)
- ❖ Ice, wave ice = H_2O ice (synoptic, mountain-wave-induced)

CALIPOP PSC Composition Classification

17 July 2008

CALIOP Antarctic PSC Climatology 2006-2015

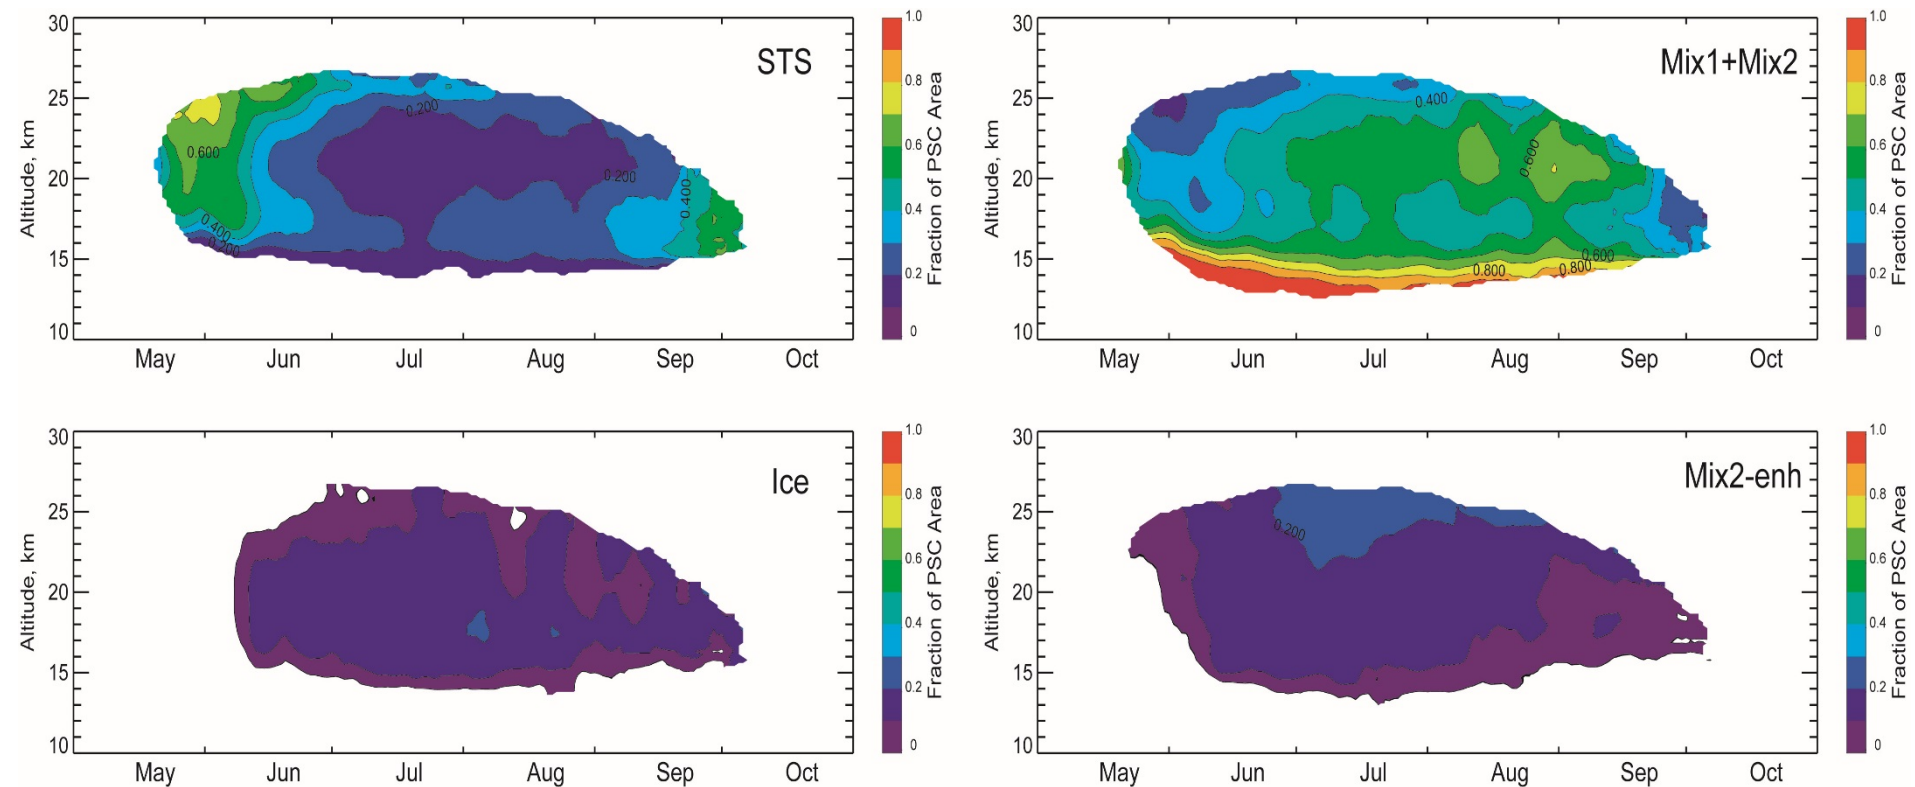

Antarctic PSC Areas: 2006–2015

Antarctic PSC Area Fraction by Composition

Vortex Average: 2006–2015

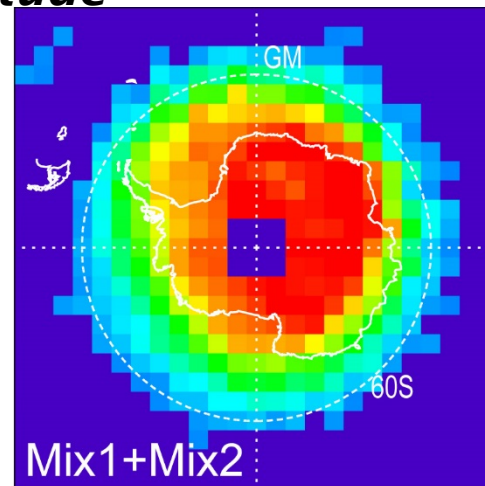

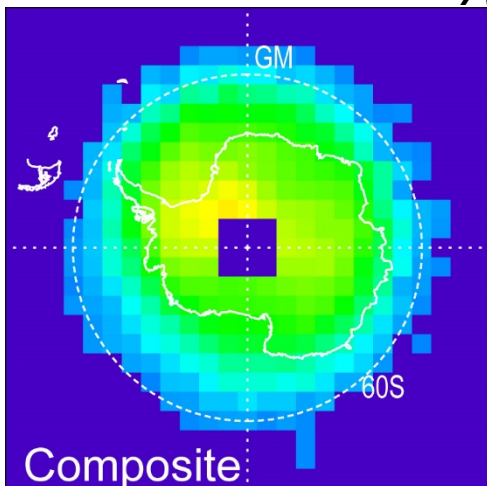

- STS is predominant composition early and again late in the season
- Mix1+Mix2 are predominant at the lowest altitudes throughout the season
- Ice PSCs are never the primary composition and typically are episodic
- Relative maximum in Mix2-enh PSCs above ~ 20 km during July–August period

Monthly Average Spatial Distributions (2006-2015)

Antarctic PSCs July at 20 km altitude

Composite

Individual

CALIOP Arctic PSC Observations 2006-2016

Arctic PSC Areas: 2006-07 to 2015-16

- Arctic vortex subject to sudden stratospheric warmings
- Interannual variability very large
- PSC extent and composition highly variable from year to year

Multi-year average is not very meaningful!

Monthly Average Spatial Distributions (2006-2015)

Arctic PSCs at 20 km altitude

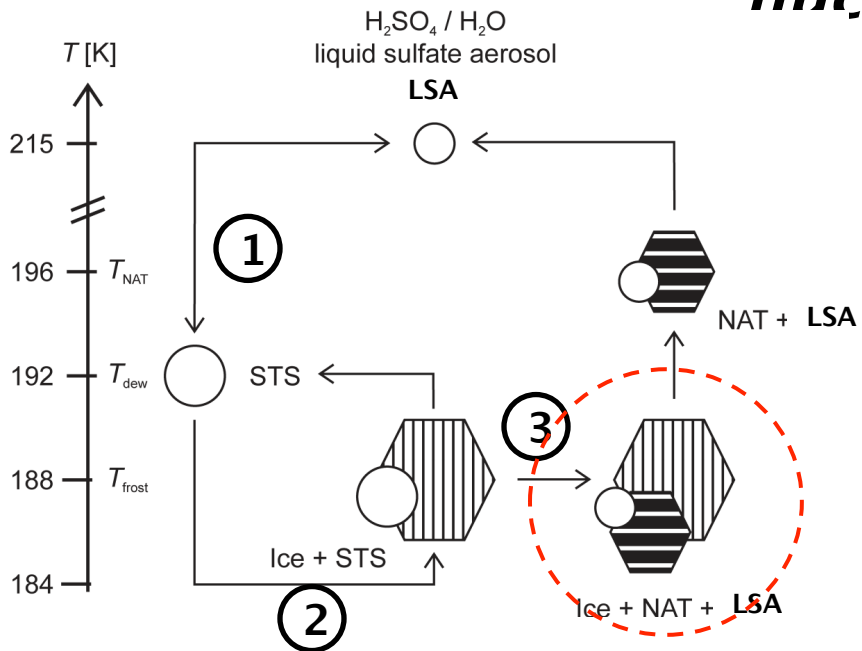

PSC Frequency

CALIPSO/microphysical modeling studies have revised our understanding of PSC nucleation

Accepted nucleation pathways

- 1) Growth of liquid particles due to uptake of HNO_3 (Dye et al., 1992; Carslaw et al., 1994)
- 2) Homogeneous nucleation of ice particles (Koop et al., 2000)
- 3) NAT nucleation on pre-existing ice particles (Carslaw et al., 1998)

- Widespread NAT PSCs observed by CALIPSO in Arctic during December 2009
- No ice PSCs observed and meteorological conditions unfavorable for ice formation
- NAT formed before ice PSCs were present- what was the mechanism?

PSC Formation: New Heterogeneous Pathway.

Heterogeneous ice and NAT nucleation on foreign nuclei imbedded in LSA (immersion freezing)

Evidence for the existence of foreign nuclei (e.g. Weigel et al., 2014)

Parameterization based on active site theory (Marcolli et al., 2007)

Heterogeneous nucleation on pre-existing solid particles (not ice) required to explain CALIOP NAT observations in December 2009

Hoyle et al., *Atmos. Chem. Phys.*, 13, 9577–9595, 2013.

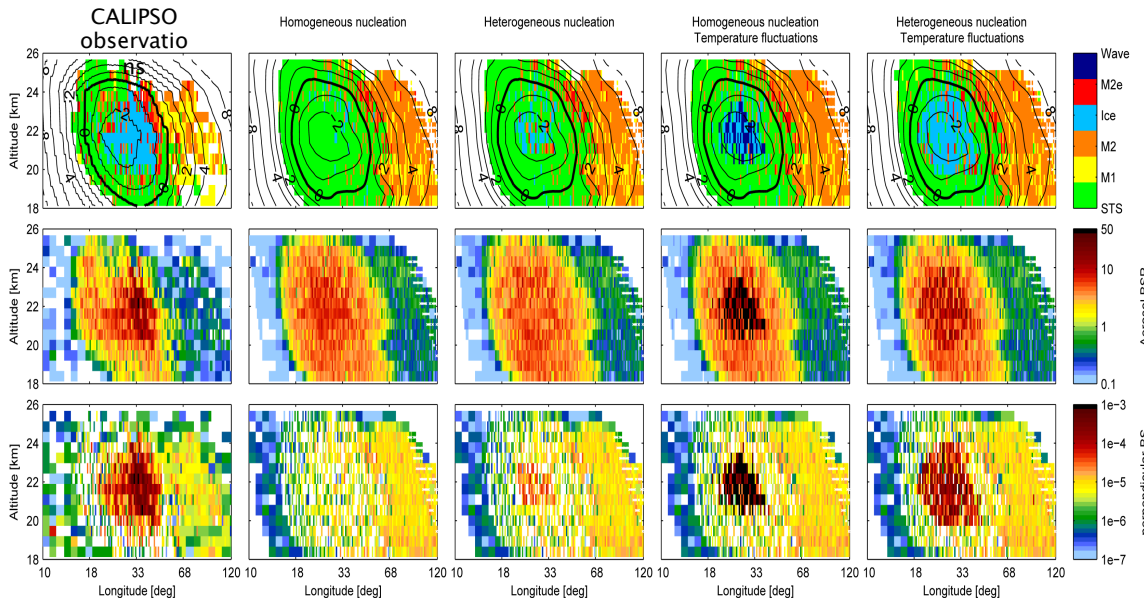

PSC Formation: New Heterogeneous Pathway.

Heterogeneous ice and NAT nucleation on foreign nuclei imbedded in LSA (immersion freezing)

Evidence for the existence of foreign nuclei (e.g. Weigel et al., 2014)

Parameterization based on active site theory (Marcolli et al., 2007)

Heterogeneous nucleation on pre-existing solid particles plus small-scale temperature fluctuations required to explain CALIOP synoptic ice observations in January 2009

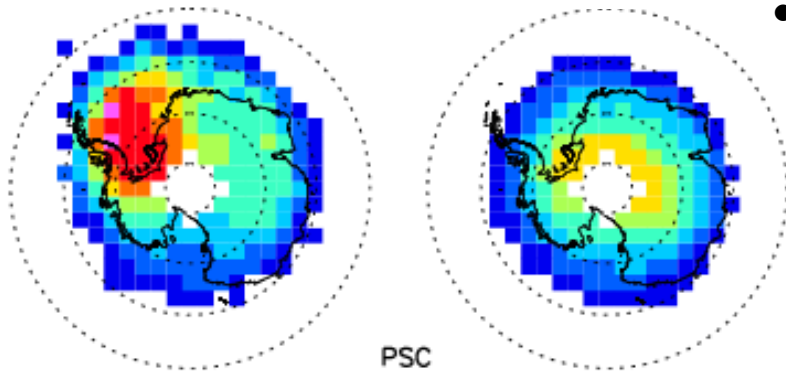

Engel et al., *Atmos. Chem. Phys.*, 13, 10769–10785, 2013.

Orographic and Tropospheric Forcing of PSCs

OGW Active

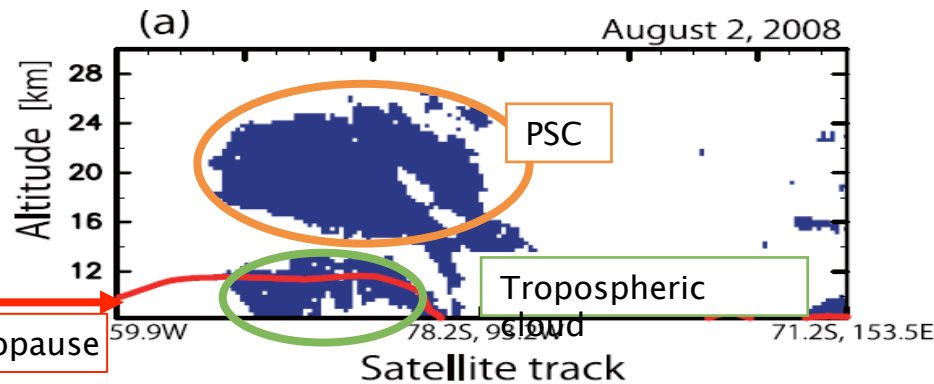

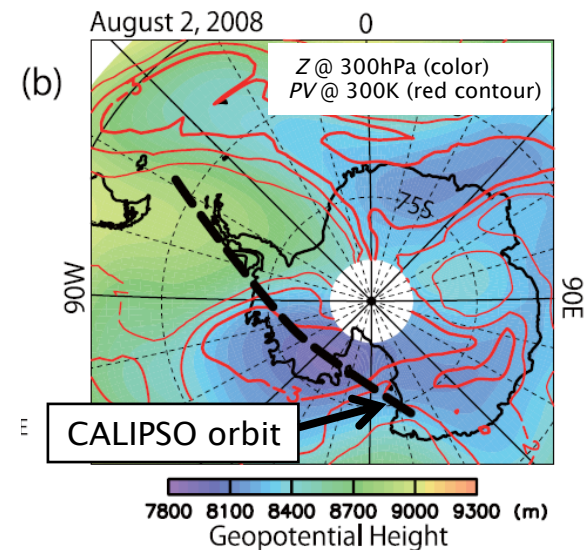

OGW Quiet

0 6 12 18 24 30 36 42 48 54 60

% of CALIOP observations (2007–10) with PSCs

- Influence of orographic gravity waves (OGW) on PSC production (Noel et al., JGR 2009; Alexander et al., JGR 2011, JGR 2013; Noel and Pitts, JGR 2012)

- Association of PSC formation with underlying upper tropospheric clouds and blocking anti-cyclones (Wang et al., JGR 2008; Adikhari et al., JGR 2010; Kohma et al., JGR 2013)

A-Train Synergy: Observations of Vortex-wide Chlorine Activation by Mesoscale PSC Event

Dec 30, 2009

Jan 02, 2010

Mesoscale PSC events in early winter can rapidly activate chlorine in just a few hours and effectively activate the whole polar vortex in a few days

Wegner et al., *Atmos. Chem. Phys.*, 16, 4569–4577, 2016

<http://www.sparc-climate.org/activities/polar-stratospheric-clouds/>

- PSCi began as a new SPARC activity in November 2015
 - Leads: Michael Pitts, Ines Tritscher, Lamont Poole, and Thomas Peter
- Main objectives:
 - Assess recent research developments related to PSCs
 - Compare remote and in situ datasets to identify their strengths and limitations
 - Identify the key PSC characteristics required by global models that can be estimated from measurements
 - Synthesize new datasets into a state of the art PSC climatology
 - Identify remaining open science questions
- Will ultimately lead to improved representation of PSC processes in global climate models
- Deliverables
 - Reference PSC data records
 - Comprehensive review paper on state of PSC science

Summary and Outlook

- CALIOP is providing a wealth of information on PSC occurrence and composition on unprecedented spatial scales
- CALIOP 10-year data record has captured primary aspects of the seasonal and multi-year variability of PSCs in Antarctic and Arctic
 - Small interannual variability in Antarctic: Multi-year averages fairly representative
 - Large interannual variability in Arctic: Each Arctic winter is unique
- CALIPSO/RECONCILE partnership has led to an improved understanding of PSC processes (POLSTRACC studies in early stage)
 - CALIPSO observations provided vortex-wide and season-long context to the focused RECONCILE campaign
 - CALIPSO/microphysical modeling studies have revised our understanding of NAT and ice nucleation
- Next major steps:
 - Development of detailed PSC reference climatology and review paper based on CALIOP, MIPAS, MLS and other datasets (SPARC PSC initiative)

BACKUP SLIDES

CALIPSO played significant role in European Arctic field campaigns

- ✓ Invited to participate as Associated Partners in RECONCILE (EU) and POLSTRACC (Germany) projects
- ✓ CALIOP quick-look images used to identify PSC regions for flight planning purposes
- ✓ Provided overall context to PSC season (Arctic-wide view of PSCs)
- ✓ Coordinated under-flights of CALIPSO with Geophysica and HALO research aircraft
- ✓ Quick-look comparison of CALIOP PSC data products with aircraft and balloon-borne data during field mission
- ✓ Partnerships have led to an improved understanding of PSC processes

Hemispheric Differences in Composition

Northern Hemisphere 2006-2015
1.31E7 total observations

Southern Hemisphere 2006-2014
2.13E8 total observations

- >15 times more PSC observations in the Antarctic
- Year-to-year variability in PSC composition much higher in the Arctic
- Fraction of ice PSCs is a factor of nine smaller in the Arctic
- Fraction of Mix 2-enh PSCs is more than a factor of two smaller in the Arctic
